Summaries 148

INTRODUCTION

The planning process, reduced to essentials, amounts to a careful, objective look at what events are occurring now, how these events are, or may be, related to what happened in the past, what form or frequency those events may assume in the future, and what can be done to either guarantee or change the likelihood that those events will occur as expected. An essential element of successful, objective planning efforts is information--information about the past, the present, and projections of the future. The use of such information is a partial guarantee that the planner's work will bear some relation to reality, and allows the planner to test his ideas about problems, or solutions, before a sizeable investment of resources is made.

The Montana Office of Comprehensive Health Planning has published their volume of Montana County Profile: Demographic Characteristics of County Populations, as an aid to the planning endeavors of the Montana Advisory Council for Comprehensive Health Planning, the Areawide Comprehensive Health Planning organizations, and the local persons involved in planning for health. Future volumes of Montana County Profiles will present information on health resources (County Health Resources), vital statistics (County Vital Statistics), and natural resources (Selected Characteristics of County Natural Resources). It is our hope that the information presented in this and future volumes will be of assistance to those engaged in planning for health, and other matters, throughout Montana.

Demographic Characteristics of County Populations

With one exception, the data contained within this volume have been taken exclusively from various volumes of the United States Census of the Population. The information contained herein by no means represents all the data contained within those Census reports--we have chosen to provide only general information of general utility. Those who need more specific information may resort to use of the Census volumes. Additional information may be sought from the Montana Office of Comprehensive Health Planning and from the Department of Planning and Economic Development of the Department of Intergovernmental Relations. The most recent data presented are of 1970 vintage. Given the relatively stable nature of Montana's population, it is assumed that these data will be adequately accurate, despite their age. Population estimate, and projections may be obtained from the Department of Planning and Economic Development annually, on a state-wide basis.

All data have been presented in tabular form. While tabular data is less easily read than graphic or mapped data we feel that accurate calculations and condensation of large amounts of information are better accomplished in this form.

The data in each table have been arranged by County. Counties are grouped with the other counties within the bounds of the Areawide Comprehensive Health Planning with which they are associated. Counties within each area have been arranged alphabetically and summary statistics for the area and the state are presented at the bottom of each column of each table. Information at a "finer" level than the county level has been omitted to limit this volume to a manageable size. Should "finer" level data be required, it is available, for most of the items presented, down to the enumeration district level.

Tables within this volume have been arranged by area to correspond with the five designated Areawide Comprehensive Health Planning organizations. In addition, a summary section has been provided, incorporating the summary statistics from each area, and state summary statistics, to facilitate interarea comparisons. Each area section of the volume has been identified by a tabbed divider sheet.

Those using this volume are cautioned to avoid use of area summary statistics without prior examination of the distribution of each statistic in each county of the area. Due to the disparity of population size among the counties of most areas, some area statistics may be biased by counties with proportionately large populations. This caution is not meant to disqualify the use of areawide summary statistics--it is included to remind the user of these data that some variables may not be uniformly distributed throughout each area.

Suggested Uses of this Volume:

Presented below are general suggestions regarding use of this data. These data do not necessarily identify problems--their primary use is to aid in the verification of problems identified by planning groups and to

suggest avenues of investigation. Specific uses of each data item will vary with the idea or problem considered.

Tables 1 (a&b) and 2 (a-d) will provide local planning groups an indication of the size and distribution of the population of their county, independently and in relation to other counties in their planning area. Also provided are historical data to aid local groups in projecting possible future events or needs. Most counties within Montana have demonstrated consistent trends over the past several decades and, according to the Montana Economic Study, will continue to do so with few exceptions. In assessing present and potential needs, and in considering alternative solution strategies to various problems, both historical data and distributional data should be of use.

Table 3, on American Indian populations, has been presented to aid in planning for the special economic, social service, health and other needs of Montana's American Indian populations.

The data presented in tables 4 (a-c), dealing with age distributions of county populations, should be of aid in estimating the present educational health, economic, housing, and other social service needs independently and in conjunction with nearby counties.

Population density data are presented in Table 5, in conjunction with total land area of each county and the number of acres of recreational land per 1000 population. The cost of delivering health and other social programs, and the incidence of health and social problems can be influenced by population density. The actual distribution of the county population within county bounds, however, is not given by density figures.

Tables 6, 7, and 8, presenting data on the county Civilian Labor Force, should be of aid in assessing economic stability and resources, and in identifying possible points of weaknesses in a county's economy. Such data may also be useful in assessing the need and feasibility of investing of county resources in various projects. In addition, health and other social problems relate to certain industry and occupational groups.

The data in Tables 9 (a&b), pertaining to welfare recipients, should be of additional aid in planning to meet health and other social needs of county populations. Again, comparison of these data with Civilian Labor Force data, housing and income data, and educational data could be illuminating, especially on an inter-county basis.

Table 10 is provided to indicate income distribution within county populations, and to aid in assessment of present and future needs or problem areas. These data should also be of some use in estimating the feasibility of various alternative plans to meet identified needs. The data in Tables 1 (a&b) on housing, also should be of use in this respect as well as in conjunction with employment, welfare and age distribution data.

Tables 12 (a&b) and 13 (a&b) present migration data for county populations. Place of origin and locational stability of population groups may influence population needs, attitudes, and the success of attempted problem solutions.

The data on educational levels of county populations, presented in Tables 14 (a&b) and 15 (a&b), can shed light on the likelihood of changes in economic conditions of the county, the appearance of particular health or other social problems, and the potential success of particular problem solution strategies.

The suggested uses of the data presented are by no means exhaustive--as with the contents of the volume, the suggestions are general, for general use. It is anticipated that users of this volume will generate their own particular uses of it. Specific data items presented within this volume should not be used without consideration of the possible effects of other items in comparisons within and between counties.

Those using this volume will doubtless discover many shortcomings within it, and will isolate items upon which more information is needed. Please notify the Montana Office of Comprehensive Health Planning so that we may in increase the utility of future volumes.
